Login Page

Here is the Java code in English, following the login window in your screenshot. It includes an account field, a password field, and a Login button.

Complete Java Code

Java

```
            password.equals("123")) {

            System.out.println("Login successful!");
            JOptionPane.showMessageDialog(
                this, "Login successful!"
            );

        } else {
            JOptionPane.showMessageDialog(
                this, "Incorrect username or password!"
            );
        }
    });

    setVisible(true);
  }

  public static void main(String[] args) {
      new BadLogin();
  }
}
```

Java

```
      new BadLogin();
  }
}
```

How to run it

1. Open VS Code.
2. Create a Java file named `BadLogin.java`.
3. Copy and paste the code above.
4. Click **Run** to start the program.

Test account

- **Username:** `admin`
- **Password:** `123`

If the credentials are correct, a "Login successful!" message will appear. Otherwise, the program will display "Incorrect username or password!"

Note: I used `JPasswordField` instead of `JTextField` for the password so that the characters are hidden when typing.

Reflection

AI 一開始給的程式沒有設定每個元件的位置，所以輸入框和按鈕可能無法正常顯示。我加上 setBounds() 來設定每個元件的位置和大小，讓登入視窗看起來更整齊。另外，我把密碼欄位從 JTextField 改成 JPasswordField，這樣輸入密碼時就不會直接顯示文字。最後，我也加入帳號和密碼的判斷，當輸入 admin 和 123 時會顯示登入成功，否則會顯示錯誤訊息。透過這次作業，我更了解如何使用 Java Swing 製作簡單的登入視窗。
